集合选择

There are multiple ways to represent sets

var set of OBJ

- good if the solver natively supports sets
- good when OBJ is not too big

array[OBJ] of var bool / 0..1

- good when OBJ is not too big

array[1..u] of var OBJ

- only for fixed cardinality u
- good when u is small

array[1..u] of var OBJx

- need to represent the "null" object

Title Week3 PPT3

Date 6/1

Keywords 关键词	Notes 笔记	Review 复习记录	/	/	/	/	/
	<h1>分配问题</h1> <p style="text-align: right;">DOM \leftrightarrow COD</p> <p>问题：士兵轮班问题，为了增加营地的安全性，刘备需要安排士兵值班，晚班需要有且只有<u>o</u>个士兵巡逻，早上不需要巡逻，傍晚需要<u>u</u>个士兵巡逻，一个士兵不能连续值晚班超过2晚，一个士兵不能值完下午班后值晚班，为了保证安全性，在给定的士兵，给定的巡逻天数的情况下，使得在这几天里，参与巡逻的人数最大化，其实就是最大化下午班人数的数量（同一士兵参与不同值班可重复计数），一个士兵不违反规定的值班安排表</p> <p>例子如下：</p> <p>代码：</p> <pre> enum SOLDIER; enum SHIFT = { OFF, EVE, NIGHT }; int: nDays; set of int: DAY = 1..nDays; int: o; int: l; int: u;</pre> <p>为每个士兵的某一天，分配给定天数中的值班时间段</p> <pre> array[SOLDIER, DAY] of var SHIFT: roster;</pre> <p>一个士兵不能连续值晚班超过2晚：</p> <pre> forall(s in SOLDIER, k in 1..nDays - 2) { sum(d in k..k + 2)(roster[s, d] = NIGHT) <= 2 };</pre>						

Keywords 关键词	Notes 笔记	Review 复习记录
⇒这样写更好 {	<pre>constraint forall(d in 1..(nDays-2), s in SOLDIER) { (roster[s,d] = NIGHT) /\ (roster[s,d+1] = NIGHT) -> (roster[s,d+2] != NIGHT)</pre> <p>一个士兵不能值完下午班后值晚班</p>	/ / / / / /
	<pre>constraint forall(d in 1..(nDays-1), s in SOLDIER) { (roster[s,d] = EVE) -> (roster[s,d+1] != NIGHT) }</pre> <p>人数上的限制</p>	
% 每天都有士兵值夜班		
constraint forall(d in DAY) {		
sum (s in SOLDIER)(roster[s,d] = NIGHT) = 0		
}		
% 每个晚班都有 $\sim u$ 个士兵巡逻		
constraint forall(d in DAY) {		
sum (s in SOLDIER)(roster[s,d] = EVE) $\geq l$		
}		
constraint forall(d in DAY) {		
sum (s in SOLDIER)(roster[s,d] = EVE) $\leq u$		
}		
目标：晚上应该有尽可能多的士兵巡逻		
var int: tOnEve = sum(d in DAY){		
sum(s in SOLDIER)(roster[s,d] = EVE)		
}		
solve maximize (tOnEve);		

Keywords 关键词	Notes 笔记	Review 复习记录	/	/	/	/	/
	<h1>Global cardinality</h1> <p>I 优化</p> <p>有公共的部分:</p> <pre>forall(d in DAY) (sum(s in SOLDIER) (roster[s,d] = EVE) >= l); forall(d in DAY) (sum(s in SOLDIER) (roster[s,d] = EVE) <= u);</pre> <p>可以使用中间变量存储被重用的表达式的值:</p> <pre>array[DAY] of var o.card(SOLDIER): onEve; onEve = [sum(s in SOLDIER)(roster[s,d] = EVE) d in DAY]; forall(d in DAY) (onEve[d] >= l & onEve[d] <= u); 或者 array[DAY] of var l..u: onEve; onEve = [sum(s in SOLDIER)(roster[s,d] = EVE) d in DAY]; 目标为 var int: tOnEve = sum(d in DAY) (sum(s in SOLDIER)(roster[s,d] = EVE)); solve maximize(tOnEve);</pre>						

Title

Date / / / / / /

Keywords 关键词	Notes 笔记	Review 复习记录
	<p>II Global cardinality</p> <p>1. global_cardinality</p> <p>约束 global_cardinality(x, v, c):</p> <p>v和c的大小相同</p> <p>约束的表达式为 $c_i = \sum_{j \in 1..n} (x_j = v_i)$</p> <p>收集计数，并限制v出现次数的计数，例如：约束x中，1出现2次，2出现1次。</p> <p>global_cardinality(x,[1,2],[2,1])</p> <p>所以可以把代码</p> <pre>forall(d in DAY)(sum(s in SOLDIER) (roster[s,d] = NIGHT) = 0); forall(d in DAY)(sum(s in SOLDIER) (roster[s,d] = EVE) >= l); forall(d in DAY)(sum(s in SOLDIER) (roster[s,d] = EVE) <= u);</pre> <p>替换为</p> <pre>array[DAY] of var l..u: onEve; constraint forall(d in DAY) (global_cardinality([roster[s,d] s in SOLDIER], [NIGHT, EVE], [l, onEve[d]])););</pre>	/ / / / / /

Keywords 关键词	Notes 笔记	Review 复习记录
	<p style="text-align: center;">Permutation 置换</p> <p>一. 问题: $B(m,n)$: 给出每个数字 $1..n$ 的 m 个拷贝。找到这些数字的序列，其中每两个 k 的连续副本中有 k 个数字</p>  <p>二. 分析:</p> <p>Map DOM = 1-1, 1-2, 2-1, 2-2, 3-1, 3-2, 4-1, 4-2 数字的有序拷贝</p> <p>三. 数据和决策</p> <pre> int: n; set of int: DIG = 1..n; int: m; set of int: COPY = 1..m; int: l = m*n; set of int: POS = 1..l; array[DIG,COPY] of var POS: po; 约束 forall(d in DIG, c in 1..m-1) (po[d,c+1] = po[d,c] + d + 1); alldifferent([po[d,c] d in DIG, c in COPY]); </pre>	/ / / / / /

Keywords 关键词	Notes 笔记	Review 复习记录	/	/	/	/	/	/
	<p>四、逆向考虑：</p> <p>DOM是位置，COD是数字副本</p> <p>我们需要将DIG × COPY映射为单个整数: $dc = m*(d-1) + c$</p> <p>$1-1, 1-2, 2-1, 2-2, 3-1, 3-2, 4-1, 4-2 = 1, 2, 3, 4, 5, 6, 7, 8$</p> <p>set of int: DIGCOP = 1..l; array[POS] of var DIGCOP: dc;</p> <p>约束 alldifferent([dc[p] p in POS]);</p> <p>进行建模 $dc[p] = dc \Leftrightarrow po[d,c] = p$</p> <p>正向思考建模代码:</p> <pre>forall(d in DIG, c in 1..m-1) (po[d,c+1] = po[d,c] + d + 1); </pre> <p>逆向约束:</p> <pre>forall(d in DIG, c in 1..m-1, p in POS) (dc[p] = m*(d-1) + c <=> dc[p+d+1] = m*(d-1) + c + 1); constraint alldifferent([dc[p] p in POS]); solve satisfy;</pre>							

Keywords 关键词	Notes 笔记	Review 复习记录	/	/	/	/	/	/
五、引入 inverse	<pre> include "globals.mzn"; int: n; set of int: DIG = 1..n; int: m; set of int: COPY = 1..m; int: l = m*n; set of int: POS = 1..l; array[DIG,COPY] of var POS: po; set of int: DIGCOP = 1..l; array[POS] of var DIGCOP: dc; constraint forall(d in DIG, c in 1..m-1)(po[d,c+1] = po[d,c] + d + 1); constraint inverse(dc, [po[d,c] d in DIG, c in COPY]); output["\n(dc[p]-1) div m + 1" p in POS]; solve satisfy; </pre>							

六 总结

- 排列问题至少要有两种观点
- 选择可能/容易表达约束和目标的观点
- 否则，选择两个视点并添加反向约束

例子：假设有n个人被排队拍照片，照片的友好值定义为一行中相邻的每对人之间的友好度之和

Keywords 关键词	Notes 笔记	Review 复习记录	/	/	/	/	/	/
	<pre> int:n; set of int: PERSON = 1..n; set of int: POS = 1..n; array[PERSON,PERSON] of int: friend; </pre> <p>如果变量为每个人的位置 array[PERSON] of var POS: x;</p> <p>Constraints: alldifferent(x);</p> <p>目标 solve maximize ...难以表达</p> <p>如果变量为每个人 array[POS] of var PERSON: y;</p> <p>Constraints alldifferent(y);</p> <p>目标 solve maximize sum(i in 1..n-1) (friend[y[i],y[i+1]]);</p>

Debug

- No solutions
- Too many solutions
- Missing solutions

How to avoid?

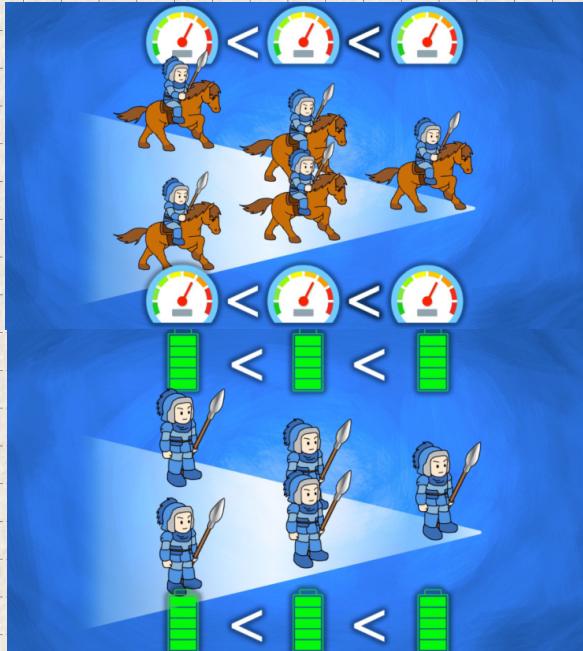

- Assertions
- Tracing a model
- Relational semantics

Review

复习记录

Keywords 关键词	Notes 笔记	Review 复习记录
	<h1>Assertion</h1> <p>一、定义</p> <p>① assert(boolexp,stringexp)</p> <ul style="list-style-type: none"> • returns true if boolexp holds, • otherwise prints stringexp and aborts <p>For example</p> <pre>eg1 array[RESOURCE] of int: capacity; constraint assert(forall(r in RESOURCE)(capacity[r] >= 0), "Error: negative capacity");</pre> <p>eg2 Write an assertion to check that consumption is non-negative where</p> <pre>array[PRODUCT,RESOURCE] of int: consumption; constraint forall(p in PRODUCT, r in RESOURCE) assert(consumption[p,r] >= 0, "consumption[\(p),\\(r)] < 0!");</pre> <p>② 另一种 assertion :</p> <pre>assert(boolexp,stringexp,exp) • returns exp if boolexp holds, • otherwise prints stringexp and aborts</pre> <p>当不是所有的模型都将被执行时，特别是当我们稍后引入谓词和用户定义函数时，这很有用</p>	/ / / / / /

Keywords 关键词	Notes 笔记
	<p>eg</p> <pre>int: n = 5; array[1..n] of var 1..n: a; array[1..n] of 1..n: b = [3,5,2,3,1]; constraint forall(j in 1..n, i in b[n-j]..n) (a[j] < i);</pre> <p>Error message</p> <pre>MiniZinc: result of evaluation is undefined: debug.mzn:5: in call 'forall' in array comprehension expression with j = 5 in binary '..' operator expression in array access array access out of bounds 溢出下界, j=5 时, ~~~~~~ i in 0..5</pre>
	<p>利用 assertion</p> <pre>int: n = 5; array[1..n] of var 1..n: a; array[1..n] of 1..n: b = [3,5,2,3,1]; constraint forall(j in 1..n) assert(n=j, "b[1..(n-j)]");</pre>
Summary 总结	<p>Error message</p> <pre>debug.mzn:5 In constraint. In 'forall' expression. In comprehension. j = 5 In comprehension head. In assert expression Assertion failure: "b[0]"</pre> <p>始终添加判断以检查输入数据的假设</p>

Keywords 关键词	Notes 笔记	Review 复习记录
<h1>Tracing models</h1>		
<p>一、问题描述：通过将奇数的部队和士兵排列成楔形来建立编队。为了保持这种阵型，越前的马速度需要越快。并且越靠前的士兵有更大的机会与敌人战斗，所以越靠前的士兵需要越大的耐力。一些马和士兵相性极差/极好，不能/可以组合在一起。确定最佳的楔形编队，以最大限度的提高强度。</p>  <p>The diagram shows a wedge formation on a blue background. At the top, three horses are shown with speedometers indicating decreasing speed from left to right. Below them, three soldiers are shown with endurance meters also decreasing from left to right. This pattern repeats three more times, creating a triangular wedge shape. Each row consists of a horse, a soldier, and a green bar representing compatibility.</p>		
<p>二、代码：</p> <pre>% Data Declarations enum HORSE; enum RIDER; array[HORSE] of int: speed; array[RIDER] of int: endur; array[RIDER] of int: strength; array[HORSE] of set of RIDER: compat; int: n; % size of wedge (should be odd) assert(n mod 2 = 1, "n must be odd"); set of int: POS = 1..n; % Decisions array[POS] of var HORSE: h; array[POS] of var RIDER: r;</pre>		

Keywords 关键词	Notes 笔记
<p>1 2 3 4 5</p>	<pre>% Constraints include "alldifferent.mzn"; alldifferent(h); alldifferent(r); forall(i in 1..n div 2) (speed[h[i]] < speed[h[i+1]] /\ endur[r[i]] < endur[r[i+1]]); forall(i in n div 2..n) (speed[h[i]] > speed[h[i+1]] /\ endur[r[i]] > endur[r[i+1]]); forall(i in POS)(r[i] in compat[h[i]]); % Objective solve maximize sum(i in POS)(strength[r[i]]); output["h = \\$(h)\nr = \\$(r)\nn = \$n"];</pre> <p>理想输出为下方代码：(但实际为 unsatisfied)</p> <pre>HORSE = {H1, H2, H3, H4, H5, H6, H7, H8, H9, H10}; RIDER = {R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11}; speed = [10, 9, 8, 7, 6, 5, 7, 4, 3, 2]; endur = [8, 4, 3, 2, 6, 4, 2, 6, 7, 5, 3]; strength = [5, 2, 8, 9, 4, 2, 1, 3, 4, 5, 9]; compatible = [{R2, R3, R11}, {R5, R6}, {R8}, {R1, R5}, {R4}, {R2, R7}, {R1, R3}, {R9, R1, R10}, {R11, R3}, {R9, R10, R7}]; n = 5;</pre> <h2>II. Trace</h2> <p>The builtin trace function prints out things during model compilation</p> <p>trace(stringexp, exp)</p> <ul style="list-style-type: none">• prints the value stringexp• and then returns exp

Keywords 关键词	Notes 笔记
Eg.	<pre>forall(i in 1..n div 2)(trace{ "speed[h[\\"(i)\"]] < speed[h[\\"(i+1)\"]]\n"; ++ "endur[r[\\"(i)\"]] < endur[r[\\"(i+1)\"]]\n"; speed[h[i]] < speed[h[i+1]] /\br/> endur[r[i]] < endur[r[i+1]]}); forall(i in n div 2..n)(trace{ "speed[h[\\"(i)\"]] > speed[h[\\"(i+1)\"]]\n"; ++ "endur[r[\\"(i)\"]] > endur[r[\\"(i+1)\"]]\n"; speed[h[i]] > speed[h[i+1]] /\br/> endur[r[i]] > endur[r[i+1]]});</pre>

Keywords 关键词	Notes 笔记
<p>二. 问题</p> <p>对于 $time[path] \text{ div } weather$, $weather=0$ 将不是解决方案的一部分 并且 $guard[path]$ 会越界</p> <p>替换 用中间变量 extra 存储者(可能)溢出的值</p>	<pre>var int: t = .. + extra * weather; var int: extra; path in POST -> extra = guard[path]; not(path in POST) -> extra = 0;</pre>
<p>或者</p>	<pre>var int: t = time[path] div weather + if path in POST then guard[path] else 0 endif * weather;</pre>
<p>三. 其他</p> <p>$\text{not}(x \text{ div } y = 1)$ not same as $x \text{ div } y \neq 1$ $(x,y) = (0,0)$ is a solution of the first</p> <pre>1 % Use this editor as a MiniZinc scratch book 2 int: x=5; 3 int: y=0; 4 bool: q1 = not(x div y = 1); 5 bool: q2 = x div y != 1; 6 7 8 output["q1=\\"q1\\"", q2="\\"q2\\"",] 9 0</pre> <p>Output</p> <p>Hide all default</p> <p>Playground:4.1-8 in variable declaration for 'q1' in unary 'not' operator expression in binary '=' operator expression in binary 'div' operator expression Warning: undefined result becomes false in Boolean context (division by zero)</p> <p>Playground:5.1-8 in variable declaration for 'q2' in binary '!=' operator expression in binary 'div' operator expression Warning: undefined result becomes false in Boolean context (division by zero) q1=true, q2=false</p>	<p>未定义(越界)返回 False</p>

Summary 总结

relational semantics:

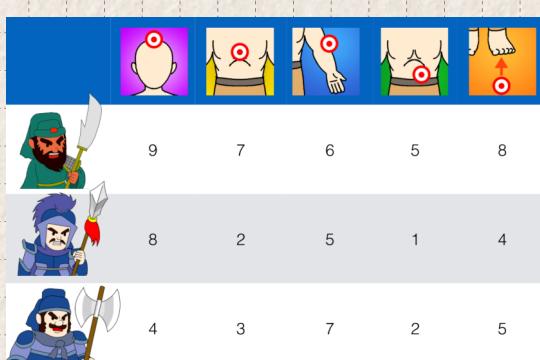

- division by zero
 - array access out of bounds
- these are just statements with no solution

尽量避免

partial function

applications:

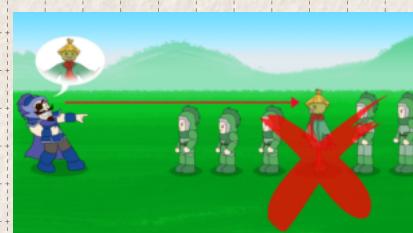

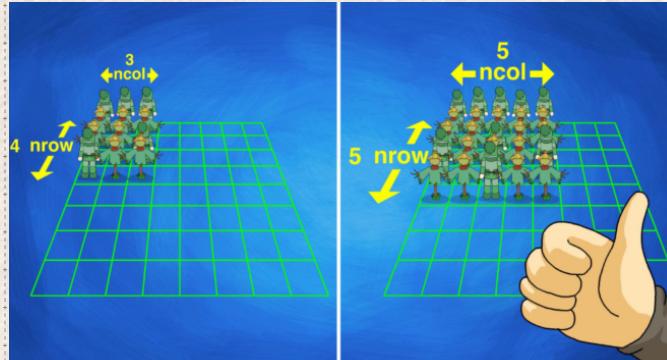

- ① $x \text{ div } y$ assure $y \neq 0$
- ② $x[i]$ assure variable or parameter i is in the index set of x

Content

内容

此章节主要讲了

1: Basic scheduling

每个任务有持续时间

任务有先后顺序，一个任务结束必须在另一个任务开始之前

目标为最小化做完所有任务的结束时间

2: disjunction scheduling

在basic scheduling的基础上涉及了overlap

3: cumulative scheduling

资源有限的scheduling

4: sequence-dependent scheduling!

single channel problem

schedule取决于在该资源上哪些任务优先于另一任务

下一任务的开始时间会因上一个任务而延迟

5: sequence dependent scheduling!

double channel problem

Review

Basic Scheduling

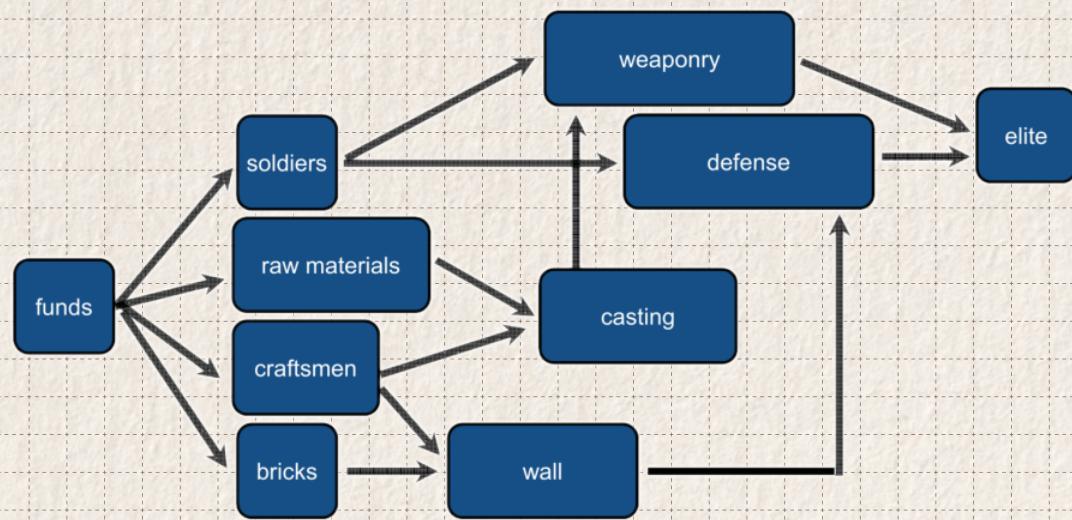

Schedule the tasks to minimize the end time

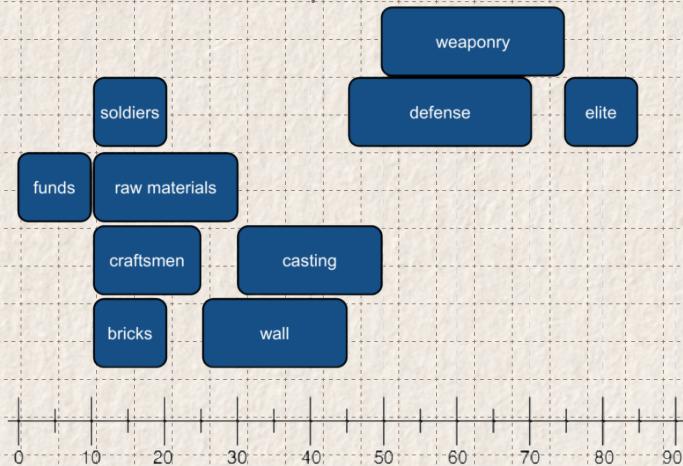

项目描述：现有三个任务：Building a wall, producing more weapons, and selecting elite soldiers.

10\$ → 15\$ hire craftsman → 20\$ building the wall
 ↓
 10\$ make bricks →

10\$ → 20\$ purchase materials → 20\$ produce weapon
 ↓
 15\$ hire craftsman

10\$ recruit
 ↓
 soldiers → \$25 join weaponry
 ↓
 \$25 defense training →
 ↓
 10\$ identify
 elite soldiers
 ↓
 \$20 building wall
 ↓
 20\$ produce weapon
 ↓
 \$20 building wall

Sequence Dependent Scheduling I

問題描述：兩城之間有若干船，須將這些船全部運送武器至對方城。船有一定行駛速度。河道只允許一個方向的船通過，因為只有一條河道。

兩船之間的安全距離為 2,000m。船發出時間須晚于開船時間，不可以在裝貨前离开。河道總長 32000 m。

Port A

#A-to-B = E

Channel

#B-to-A = L

■ Data

```

int: len;

int: nS; % number of ships
set of int: SHIP = 1..nS;
array[SHIP] of int: speed;    % 1000m time
array[SHIP] of int: desired; % desired time
int: atob = 1; int: btoa = 2;
array[SHIP] of atob..btoa: dirn;

int: leeway;   % leeway between 2 ships
int: maxt;      % maximum time
set of int: TIME = 0..maxt;

```

Scheduling

The *makespan* is the time it takes for all tasks to finish. Assuming that we start at time 0, which of the following will calculate the makespan? Given the following:

- TASK is the set of all tasks,
- dur[t] is the duration of a task t
- start[t] is the time a task t starts
- end[t] is the time a task t ends

- $\text{forall } (t \text{ in TASK}) (\text{start}[t] + \text{dur}[t]);$
- $\max (t \text{ in TASK}) (\text{end}[t]);$
- $\max (t \text{ in TASK}) (\text{start}[t]) + \max (t \text{ in TASK}) (\text{dur}[t]);$
- $\sum (t \text{ in TASK}) (\text{end}[t]);$

Symmetries and Dominance

Which of the following best explains variable symmetry?

- Given a solution, if we can scramble the assigned values of the variables (not necessarily resulting in the same values in total), and we still have a solution, then we have a variable symmetry.
- Given a solution, if we can scramble the assigned values of the variables, so that we have the same values in total (but not necessarily associated with the same variable as before), and we still have a solution, then we have a variable symmetry.
- If we swap the position of the variables, and we get a solution, then we have a variable symmetry.
- If it doesn't matter how we swap the values of the variables, we still end up with a solution, then we have a variable symmetry.
